

Fork Positioner for Forklifts

Fork Positioner for Forklifts - The fork positioner is a hydraulic apparatus which could allow the person driving to operate the lift truck without leaving the seat. They are constructed out of top quality materials and are meant to withstand the most challenging operations and work surroundings. Side shifting units have the added ability to laterally position the entire load or the arms so as to facilitate more exact lifting and placement in a quicker and much more efficient way.

The blade pocket is somewhat unique and enables the individual operating it to securely swing the blades into position without any fear of damaging the positioning cylinders. This could allow the operator the option to be able to execute simultaneous or independent fork movement, dependent upon the requirements of the job. For most lift trucks with non-OEM carriages, complete carriages are considered necessary. Standard OEM carriages can be converted into blade positioners on available units.
